

ABSTRACT OF THE DISCLOSURE

An apparatus and method for providing secondary broadcast services in a digital broadcasting system including a transmitter and a receiver. The transmitter transmits summary information and control data of broadcast channels through a control channel while allocating the summary information and the control data to a data transmission section, and transmits a secondary broadcast corresponding to the summary information while allocating the summary information to at least one of a plurality of broadcast channels. The receiver receives a signal transmitted through the control channel, displays the summary information after retrieving the summary information from the data transmission section, and receives a broadcast channel through which the secondary broadcast corresponding to the summary information is transmitted when there is a request to receive the secondary broadcast.
